

## Company Profile

Founded in the early 1990s as a Berlin-based technology start-up, today, First Sensor is a globally active sensor specialist with around 1,000 employees. With our expertise in design and the production of sensor chips as well as microsystems technology, we develop and manufacture **standard sensors** and tailored **solutions** in the fields of photonics, pressure, and advanced electronics.

How is our world changing? What kind of innovations will be part of the course of tomorrow? These are the questions that drive our growth. In our **Industrial target market**, which accounts for around half of our sales, sensors are, among other things, at the heart of intelligent processes and have a significant impact on quality, economy, and safety. In the **Medical target market** our customers have been relying on the precision and durability of our products for many years. A quarter of our sales is generated here. We are there when state-of-the-art diagnostics save lives and we help with taking the first breaths. And in our **Mobility target market** a new era has begun in which more and more vehicles are moving through traffic green, networked, and autonomous. As a reliable supplier to leading automotive groups, we are at the forefront and generate around a quarter of our sales with sensor technology for automotive applications.

These accomplishments are the result of our **innovative strength**, our claim to **excellence** and our **proximity** to customers, employees and partners. As a manufacturer of sensors and sensor systems "Made in Germany", we are primarily present in Europe, North America and Asia and can serve customers in 140 countries through the TE network.
